

## FOSC-OC-XC

### Coarse wavelength division multiplexing in FOSC trays

The coarse wavelength division multiplexing technique combines (or multiplexes) two or more signals with different wavelengths in one common fiber. The same components can also be used to separate the wavelengths (de-multiplexing) at the remote location.

These devices are integrated into the Tyco Electronics FOSC range of fiber-optic splicing trays.

This allows for easy integration in enclosures, wall-mount boxes, or ODFs.

#### Advantages

- Consistent performance
- Low optical loss
- Low polarization sensitivity
- Excellent mechanical and environmental characteristics
- Fast installation and commissioning

#### Applications

- CWDM upgrades in metro networks
- Increase the capacity between the central office and the headend in HFC networks
- CWDM overlay in PON architectures
- LAN

The CWDM components are based on TFF (thin-film-filter) technology.

These components are standard placed in the "TOAST" protective sealing to ensure a correct operation in outside plant conditions.

### Notes

- Refer to the FOSC trays ordering guide for tray dimensions.
- The FOSC-OC-3 tray has been provided with holders for heat-shrinkable splice protectors to splice the incoming fibers.
- The FOSC-OC-6 is a black box concept and therefore does not allow splicing the in- and outgoing fibers on this tray. Pre-installed tubes will route these fibers to another tray in the enclosure.
- The FOSC-OC-7 and FOSC-OC-8 provide pre-terminated in- and outputs of the CWDM. Outside plant fibers can be spliced on a standard FOSC tray to 900 micron pigtailed and be routed to the CWDM tray.
- Not all configurations are possible. Please consult your local sales engineer for confirmation.
